

Zik Pass — Two-Lane Assurance Model

Overview

Zik Pass uses a Two-Lane Assurance Model to verify that a user is over 18 while preserving privacy and maintaining flexibility.

Lane 1: Remote Verification (Privacy-First)

- No photo ID or biometrics required
- Uses financial signals, bank verification, device binding, and cooling-off
- Assurance Level: remote_standard

Lane 2: In-Person Verification (High Assurance)

- Physical ID check at partner location
- Immediate or reduced cooling-off
- Assurance Level: in_person_verified

Unified Credential Model

Both lanes issue a Zik Pass with different assurance levels embedded.

Vendor Integration

Vendors choose which assurance levels to accept based on risk.

Security Philosophy

Layered, context-appropriate assurance rather than absolute identity certainty.

Summary

Zik enables flexible, privacy-first age verification with scalable and high-assurance options.
